The WCP

The *Weekly Coal Production* (WCP) provides weekly production estimates of U.S. coal by rank, as well as supplementary data which are published twice a month. Supplement 1 includes monthly statistics on U.S. coal production and aggregated annual historical data on coal supply and demand, consumption, stocks, imports, and exports. Supplement 2 contains monthly data covering electric utility coal consumption, stocks, and receipts; and coal imports and exports.

This report is prepared by the Coal Division, Office of Coal, Nuclear, Electric and Alternate Fuels, Energy Information Administration (EIA) to fulfill its data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (P.L. 93-275) as amended. *Weekly Coal Production* is intended for use by industry, press, State and local governments, and consumers. Other reports that may be of interest are the quarterly *Coal Distribution Report* and the *Quarterly Coal Report*.

General information about this report may be obtained from Robert Harris, Chief, Data Systems Branch (202/252-2982). For specific information regarding the preparation and contents of this publication, contact Ann Ducca (202/252-6875) or Judith Wood (202/252-5228).

Weekly Coal Production
Energy Information Administration

Highlights

Production of bituminous coal and lignite in the week ended October 6, 1984, as estimated by the Energy Information Administration, was 16,425,000 short tons. This was a decrease of 3,611,000 short tons or 18.0 percent from production in the previous week. Production in the corresponding week of 1983 was 16,416,000 short tons. Bituminous coal and lignite production from January 1 through October 6, 1984 totaled 708,848,000 short tons, 19.6 percent above production in the same period of 1983.

Production of Pennsylvania anthracite in the week ended October 6, 1984, as estimated by the Energy Information Administration, was 95,000 short tons, 6,000 short tons or 5.9 percent less than production in the previous week. Production in the corresponding week of 1983 was 95,000 short tons. Anthracite production from January 1 through October 6, 1984 totaled 3,045,000 short tons, 1.2 percent above production in the same period in 1983.

Methodology

Methodology

The methodology for making weekly estimates of coal production and monthly estimates of coal production, consumption, and stocks is described here.

Production

Coal production estimates by State are published in this report for the current week. The EIA also publishes monthly estimates of total coal production in the *Monthly Energy Review* (DOE/EIA-0035) and quarterly production data by State in the *Quarterly Coal Report* (DOE/EIA-0121).

Weekly Data

Estimates of national weekly coal production are based on weekly data obtained from the Association of American Railroads (AAR). The AAR collects data from its members (Class I Railroads) and certain other railroads on the number of railroad cars loaded with coal each week. These carload figures are converted to tons by EIA.

EIA calculates the average number of tons per carload for each railroad's coal car fleet from information obtained from the most recent Quarterly Freight Commodity Statistics filed by Class I Railroads with the Interstate Commerce Commission. The average tons per carload is then multiplied by the number of cars loaded to obtain an estimate of weekly production shipped by rail.

To obtain an estimate of total coal production for a specific week, the total rail tonnage for the week is divided by a factor representing the proportion of all tons produced for the quarter that were shipped by rail. Because data for the current quarter are not available, data for the same quarter in the previous year are used. The rationale for using the same quarter is to reflect seasonal variation in coal production. Occasionally, the ratio of rail traffic to total production is adjusted to take additional, more current information into consideration. For example, in determining the ratio for the first quarter of 1983, the percentage obtained for 1982 data was increased by one percentage point to reflect an apparent decline in producers' and distributors' stock levels.

Once the estimate of U.S. total coal production for the week is determined, this total is split into two subtotals - the sum of anthracite and of States with little or no rail coal shipments and the sum of the remaining States - using the current quarterly State-level coal production projections. The methodology used to project State

coal production is given in the EIA publication *Model Documentation of the Short-Term Coal Analysis System (SCOAL)* (DOE/EIA-0394). First, for each State the ratio of State production projected for the current quarter divided by total U.S. production projected for the current quarter is determined. Next these ratios are multiplied by the weekly estimate of U.S. total coal production to arrive directly at the weekly coal production estimate for the six (6) coal-producing States of Alaska, Arizona, Georgia, Iowa, Texas, and Washington where there is little or no railroad coal shipments information and for the Pennsylvania anthracite production estimate. The remaining 19 States and Pennsylvania bituminous area are derived from weekly carload data provided by AAR and from information received annually from the Federal Railroad Administration (FRA), U.S. Department of Transportation. The data provided by the FRA are from its Carload Waybill Statistics survey which shows the approximate annual coal tonnage originated on the major coal-hauling railroads in each State.

Each railroad's share of rail traffic originating in States it served in the base year (currently the 1982 FRA data) are applied to the current week's tonnage derived from total system carloading reports filed with the AAR. The tonnages loaded by the various railroads are then totaled for each State to determine total production shipped by rail for that State. The tonnages are then divided by the base year's ratio of rail tonnage (derived from the waybill sample) to total production for each State. The resulting weekly production estimates for these States are totaled and compared with the national weekly coal production estimate which was derived as previously stated less estimates of production for the six nonrail States, and Pennsylvania anthracite area. The difference between the sum of production of the 20 States with rail traffic, and the sum of production in these States derived from the national production estimate, is distributed proportionately among the 20 States using the tonnage distribution for the current week determined from the waybill data to determine the weekly coal production estimate for each of these 20 States.

The rationale for using the waybill data for these 20 States rather than using the SCOAL projected production data is that with the waybill data, the State level production estimates for these 20 States are sensitive to changes in individual railroad loadings due to strikes or holidays.

Monthly Data

Preliminary estimates of monthly coal production by State are the sum of weekly coal production estimates

published in this report. If a week extends into a new month, the production is allocated by day, and the days are added to the month in which they occur. The allocation is Monday through Friday, 18.4 percent each day; Saturday, 8.0 percent, and Sunday, 0.0 percent.

Quarterly Data

Preliminary weekly and monthly production estimates are revised quarterly when quarterly production reported on the *Coal Distribution Report*, Form EIA-6, becomes available. Preliminary weekly and monthly estimates are proportionately adjusted to conform to the quarterly production figure. The national estimate of quarterly coal production as reported on Form EIA-6 is adjusted by one percent to derive the quarterly U.S. coal production total. The one percent increase is entirely assigned to the Appalachian region, giving an adjusted total for this region. Such an adjustment is required because production reported on Form EIA-6 has consistently been one percent below the final U.S. coal production level with all of the unreported tonnage confined to East Kentucky in the Appalachian region. Quarterly State production figures are determined as follows:

Appalachian Region

Quarterly production for the Appalachian Region States is equated to the production reported on Form EIA-6 for the Appalachian Region (i.e. coal-producing Districts 1-4, 6-8, 13, 24) plus one percent of the U.S. total production as reported on Form EIA-6. Quarterly production in Georgia, Ohio, and Pennsylvania (anthracite only) can be identified from Form EIA-6 reports. A report of quarterly coal production in Alabama is obtained from that State's mining agency. Initial estimates of monthly production in Alabama, Georgia, Pennsylvania anthracite, and Ohio are adjusted to conform to these new quarterly production levels. Quarterly production in Maryland, Pennsylvania (bituminous) and West Virginia are derived from monthly State coal production reports. Initial monthly estimates of production in Maryland, Pennsylvania (bituminous) and West Virginia are revised to conform to monthly reports of production from mining agencies in these States. Since production in Eastern Kentucky, Tennessee, and Virginia cannot be determined from Form EIA-6 and is not available from mining agencies in these States, initial estimates of quarterly production are not revised except for Eastern Kentucky. Quarterly coal production for Eastern Kentucky is equated to the adjusted total for the Appalachian Region minus the revised quarterly production totals for the other States in the Region.

Interior Region

Quarterly production for the Interior Region States is equated to the production reported on Form EIA-6 for

the Interior Region (i.e. Coal Producing Districts 9-12, 14 and 15). Quarterly coal production in Illinois, Indiana, Iowa, Western Kentucky, and Texas can be identified from Form EIA-6 reports. Initial estimates of monthly production in these States are adjusted to conform to these quarterly levels. Production data for Arkansas, Kansas, Missouri, and Oklahoma is not available from Form EIA-6 or from State mining agencies, hence, initial estimates of quarterly production are not revised for Arkansas, Kansas, and Missouri. Oklahoma quarterly production is equated to the total for the Interior Region minus the sum of the revised quarterly production figures for the other States in the Region.

Western Region

Quarterly production for the Western Region States is equated to the production reported on Form EIA-6 for the Western Region (i.e. Coal Producing Districts 16-23). Quarterly production in all States can be identified from Form EIA-6 reports. Initial estimates of monthly production in Alaska, Arizona, Colorado, Montana, New Mexico, North Dakota, Utah, Washington, and Wyoming are adjusted to conform to the quarterly production as reported on Form EIA-6.

Finalizing of Annual Production

Preliminary total annual U.S. coal production as reported in the WCP in the first week in January of the following year is the sum of revised monthly/quarterly estimates of production for the first nine months (first three quarters) and preliminary estimates of production derived from weekly estimates during the fourth quarter. When production data for the fourth quarter of the year become available from Form EIA-6 in March of the following year, the preliminary fourth quarter U.S. total production figure and the preliminary State-level corresponding production figures may or may not be revised depending upon whether the difference between the estimates and fourth quarter data are small or not. EIA attempts to limit revisions to the initial annual production estimates (determined initially in January of the following year) until production data is finalized in September of the following year. In some cases, quarterly, monthly, or weekly estimates may be revised without revisions to U.S. total estimates due to available monthly or quarterly State coal production reports.

Weekly, monthly and quarterly State and national production data are adjusted to conform with finalized annual production in September of the following year.

Consumption

Estimates of coal consumption are published in this report on a monthly basis. The EIA also publishes monthly estimates of coal consumption in the *Monthly Energy Review* (DOE/EIA-0035) and quarterly consumption

data in the *Quarterly Coal Report* (DOE/EIA-0121) report

Monthly Data

Coal consumption at electric utility plants is derived directly from the *Monthly Power Plant Report*, Form EIA-759. Prior to 1980, monthly coal consumption at coke plants was derived directly the *Coke Plant Report*, Form EIA-5. For 1980 and subsequent years, monthly coal consumption at coke plants is derived from the quarterly coal consumption reported on Form EIA-5. These quarterly coal consumption figures are converted to monthly coal consumption figures using the ratios of monthly to quarterly consumption in 1979, the last year that coke plant data were collected monthly on Form EIA-5. These ratios by month (January-December) are: 0.3377, 0.3200, 0.3423; 0.3529, 0.3462, 0.3009; 0.3364, 0.3347, 0.3289; and 0.3273, 0.3301, 0.3426.

Prior to 1978, coal consumption for the *Other Industrial* sector (i.e., industrial users minus coke plants) was derived by using monthly data reported on the *Quarterly Coal Consumption Report - Manufacturing Plants*, Form EIA-3, to modify baseline coal consumption figures from the most recent Census of Manufacturers or Annual Survey of Manufacturers, Bureau of the Census, U.S. Department of Commerce. For 1978 and subsequent years, data from Forms EIA-3 and EIA-6 are used to compute monthly coal consumption for the *Other Industrial* sector.

Given the quarterly consumption for the *Other Industrial* sector (C), the monthly consumption for the sector (Cm) can be estimated for each month in the quarter as $C_m = (C_{m3}/C_3) \times C$ where C_{m3}/C_3 is the ratio of monthly to quarter coal consumption as reported on Form EIA-3. For the 1978 coal consumption figures, the ratios used are based on 1978 EIA-3 data. For 1979 and subsequent years, the ratios used are based on the 1979 EIA-3 data. These 1979 ratios by month (January-December) are: 0.3593, 0.3264, 0.3143; 0.3485, 0.3332, 0.3183; 0.3317, 0.3407, 0.3276; and 0.3045, 0.3253, 0.3702.

Prior to 1980, monthly coal consumption for the residential and commercial sector was derived by using monthly data reported on Form EIA-2, *Monthly Coal Report - Retail Dealers and Upper Lake Docks*, to modify baseline coal consumption figures developed by the Bureau of Mines, U.S. Department of the Interior.

For 1980, the quarterly coal consumption figures in the residential and commercial sector are equated to quarterly coal distribution as reported on Form EIA-6. These quarterly coal consumption figures are converted to monthly coal consumption figures using the ratios of monthly to quarterly coal deliveries to this sector in 1979 as reported on Form EIA-2. These 1979 ratios by

month (January-December) are: 0.4002, 0.3502, 0.2496; 0.4805, 0.2901, 0.2294, 0.3126, 0.2952, 0.3922; and 0.2931, 0.3101, 0.3968. The 1981 and 1982 monthly coal consumption figures were derived using the 1979 ratios but were also modified according to an temperature degree-days. For 1983 and subsequent years, coal consumption figures are converted to monthly coal consumption figures using only the ratios of monthly to quarterly coal deliveries to this sector in 1979.

Quarterly Data

Coal consumption data are derived for each end-use sector as follows:

Electric Utilities - Consumption is reported on Form EIA-759.

Coke Plants - Consumption is reported on Form EIA-5.

Other Industrial - In deriving a quarterly estimate for coal consumption for the *Other Industrial* sector, the first step is to equate consumption to beginning stocks plus receipts minus ending stocks. In terms of an equation, consumption can be expressed as: $C = S_b + R - S_e$ where S_b = beginning stocks, R = receipts, and S_e = ending stocks.

From the above equation, consumption is: $C = (S_b - S_e \text{ (change in stocks)}) + R$. Next, stock change at the State level is equated to the stock change for that State as reported on Form EIA-3, receipts at the State level are derived as described in Section 3 above and a computed consumption is derived using the equation above for each State. Finally, the quarterly consumptions (C) at the State level are equated to the maximum of the computed consumption at the State level as described above and the quarterly consumption for that State as reported on Form EIA-3. This process ensures that State level consumption for the *Other Industrial* sector is always greater than or equal to the *Manufacturing* sector consumption for that State. Total quarterly consumption for the *Other Industrial* sector is computed by summing the quarterly State level consumption figures. (Consumption presented by Standard Industrial Classification (SIC) Codes is reported on Form EIA-3, i.e. by *manufacturing* plants only.) See Technical Note 1 above, which discusses the difference between *other industrials* and *manufacturers*.

Residential and Commercial - Shipments to the *residential and commercial* sector are reported on Form EIA-6 and are defined as consumption for this end-use sector. (*Residential and commercial* consumption is equal to *residential and commercial* receipts.)

Stocks

Estimates of coal stocks are published in this report on a monthly basis. The EIA also publishes monthly estimates of coal stocks in the *Monthly Energy Review*

(DOE/EIA-0035) and quarterly stocks data in the *Quarterly Coal Report* (DOE/EIA-0121) report.

Monthly Data

Coal stocks at electric utility plants are derived directly from Form EIA-759. Prior to 1980, coal stocks at coke plants were derived directly from Form EIA-5. For 1980 and subsequent years, monthly coal stocks at coke plants were obtained from stock levels reported at the end of each quarter on Form EIA-5. The stock level at the end of the first month of a quarter at coke plants is equal to ending stocks as reported on Form EIA-5 for the previous quarter plus (minus) one-third of the current quarterly stock increase (decrease). The stock level at the end of the second quarter is equal to the stock level at the end of the first month plus (minus) one-third of the current quarterly stock increase (decrease). The stock level at the end of the third month is equal to the stock level at the end of the current quarter.

Prior to 1978, coal stocks for the *Other Industrial* sector (i.e. industrial users minus coke plants) were derived by using monthly data reported on Form EIA-3, to modify baseline coal stock figures from a one-time survey of coal consumers by the Bureau of the Mines, U.S. Department of the Interior. For 1978 and subse-

quent years, the data source for stocks in the *Other Industrial* sector is Form EIA-3. Quarterly stock changes in period of 1978-1982 were judgmentally apportioned by month based on seasonal influences on supply and demand for coal in steam-coal markets. For 1983 and subsequent years, quarterly stock changes reported on Form EIA-3 are apportioned by month in the same manner as described for coke plants in the preceding paragraph.

Quarterly Data

Coal stocks are derived for each end-use sector as follows:

Electric Utilities - Stocks are reported on Form EIA-759.

Coke Plants - Stocks are reported on Form EIA-5.

Other Industrial - Stocks are reported on Form EIA-3, i.e., stocks at *manufacturing* plants only. See Technical Note 1 above, which discusses the difference between *other industrials* and *manufacturers*.

Residential and Commercial - not available. See Technical Note 2 above.

Producer and Distributor - Stocks are reported on Form EIA-6.
